JANUARY 1955

Volume LIX No. 1

ASHEVILLE: 1955

WEATHER SUMMARY

In January, 1955, as in December, 1954, high pressure systems, centered over the Great Basin, were an important part of the weather picture. Moderate to heavy precipitation was featured on the 1st, 5th, 9th, 15th through the 24th, and the 31st of the month. Temperatures were almost continually below normal throughout the month, except that during the last week in the Sierra Nevada and Southern California areas they were mostly normal or above. Precipitation was mostly below normal in the northern one-third of the State, and was above normal in the southern two-thirds. Weather in the Great Central Valley was characterized by an excessive amount of fog from the 4th to the 29th of the month. Sunshine in the same area varied from 37 to 56 percent of the possible. A slight earthquake was felt in Long Beach on the 25th. Heavy hail occurred at Wilseyville, Calaveras County, on January 1st. On January 6th at the same place a damaging windstorm occurred. Again at Wilseyville, on the 15th, a heavy snowstorm caused some damage. On January 18th, in the downtown area of the city of Los Angeles, a small, tornado-like wind of approximately five minutes duration was reported.

The average temperature for the State was 40.6°, or 3.2° below the normal. Monthly average temperatures were consistently below normal, with but two stations, China Flat and Torrance, showing departures slightly above normal. As regards the extremes for the month, most maximum temperatures occurred during the last decade of the month, and most minimum temperatures during the first decade. The highest temperature reported was 88° at Yorba Linda on the 27th; the lowest was -16° at Soda Springs on the 4th.

The average precipitation for the State was 3.72 inches, or 0.26 inch below the normal. In the North Coast, Sacramento, and Northeastern Interior Drainage Basins precipitation was consistently below normal, only five stations reporting totals greater than the normal. In the remainder of the State departures were as consistently above normal, only 20 stations reporting totals less than the normal. The greatest monthly total reported was 12.35 inches at Sierra City; the least was 0.19 inch at Cow Creek. The greatest amount reported in any 24-hour observational period was 3.45 inches at Grant Grove on the 1st, and at Giant Forest on the 2nd.

Huntington Lake, Fresno County, elevation 7020 feet, reported the greatest monthly total of snowfall of 100.0 inches, with a maximum accumulation on the ground of 73 inches on the 18th. Next was Big Bear Lake Dam, San Bernardino County, 6815 feet, with a total of 98.0 inches, and a maximum accumulation of 68 inches on the 19th. The third greatest total was at Twin Lakes, Alpine County, 7920 feet, with 89.5 inches, and a maximum accumulation of 83 inches on the 18th.

In the north coastal area low temperatures and frequent rains resulted in little or no farming activities.

In the central coastal area spraying, pruning, and cultivating continued where weather conditions permitted it. Soils were generally too wet for planting and harvesting. Cold weather was unfavorable for the growth of grasses, cover crops, grains, and winter vegetables, but was favorable for the winter chilling of fruit trees.

In the upper Sacramento Valley low temperatures and frequent rains delayed or halted all spraying, pruning, and cultivation, and seriously interfered with the harvesting of strawberry plants. Sprouting grains were unfavorably affected by wet soil, but showed some increase of growth due to warmer temperatures during the last week of the month. Lambing was well past the peak by the close of the month, with losses due to unfavorable weather being light.

In the lower Sacramento Valley spraying, pruning, and cultivating continued sporadically, being frequently interrupted by wet weather. Low temperatures retarded the growth of pastures, ranges, winter vegetables, and winter planted grains, but fall planted grains continued in good condition.

In the lower San Joaquin Valley wet weather retarded cotton picking, and caused some deterioration of the crop. Winter vegetables, pastures, ranges, and grains were benefited by the rains, but were retarded by low temperatures. Wet weather retarded the orange harvest, but low temperatures did no damage, although some orchard heating was necessary. Winter grain seeding was held up in some instances by rain.

In the upper San Joaquin Valley temperatures considerably below freezing occurred during the first decade of the month, although very little damage resulted, mostly as a result of orchard heating in critical areas. Frequent rains benefited pasture and range growth, but the resulting wet soil hindered farm work, such as cultivating, potato planting, and grain sowing.

In the Santa Maria area below freezing temperatures during the week ending on the 17th resulted in considerable damage to artichokes. Persistent low temperatures up to the last week of the month slowed the growth of winter vegetables, pastures, ranges, and grains, largely offsetting the benefits of frequent rains.

In the Los Angeles area frost caused some damage to avocados, celery, winter vegetables, and unheated citrus groves. Persistent low temperatures up to the last week of the month retarded growth of citrus crops, winter vegetables, grasses, and grains. Strong winds occurred on the 16th, throughout the metropolitan area, and a small, tornado-like wind occurred in downtown Los Angeles on the 18th. This storm was responsible for about $10,000.00 worth of damage to trees, fences, plate glass windows, roofs, ventilators, and automobiles. Frequent precipitation throughout the month contributed generously to subsurface moisture, water in reservoirs, and the snowpack in the mountains, improving the water situation generally for the coming season. Warm weather during the last week of the month accelerated the growth of grains, grasses, and cover crops, and contributed to the swelling of deciduous buds, with a few early almonds blooming as a result. In this period low relative humidities resulted in considerable drying of topsoils, although rains near the end of the period alleviated this condition somewhat.

In the San Diego area freezing temperatures at the beginning of the month killed all tomato plants, ended the harvesting of all vegetables except celery, which even so, was considerably damaged, and damaged citrus fruits, avocados, and other fruits in low, unheated orchards. Rainy weather benefited all crops. The San Diego office of the Weather Bureau reports that this is the first month in that area with precipitation above normal since March, 1954. During the last week of the month weather conditions were favorable for the cultivation of the soil, the planting and growth of grains, and the harvesting of fruit and truck crops.

In the Imperial Valley frost caused the defoliation of cotton plants, with some picking still in progress. Cool weather during the first decade was favorable for the heading of lettuce. Strong winds, rain, and low temperatures during this period caused some damage to alfalfa, cantaloupe and watermelon vines, and hindered various other agricultural activities.

The windstorm at Wilseyville, Calaveras County, on the 6th caused approximately $3000.00 worth of damage to roofs of residential and industrial buildings. No estimate was available as to the amount of damage caused by the heavy hail on the 1st, and the heavy snowstorm on the 15th at the same place. On the 16th approximately 200 trees were blown down in metropolitan Los Angeles.

L. W. Browne

REFERENCE NOTES

The four digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree Days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 1 0 a.m. PST, except for Tahoe; WB AP which is 10 30 a.m., PST, Blue Canyon WB AP and Sandberg WB 6.00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of the snow on the ground. It is measured at observation time on days when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations, consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

Thermometers are exposed on roof.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder station. These stations are processed for special purposes and are published only in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if affected by this [illegible]

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data [illegible]

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may obtained by writing to the Weather Bureau, [illegible] 57 Federal Building, 50 Fulton Street, San Francisco 2, California.

FEBRUARY 1955
Volume LIX No. 2

ASHEVILLE: 1955

WEATHER SUMMARY

The mean February flow pattern (or the prevailing air flow at about 10,000 ft. on which the average weather largely depends) showed above normal high pressure over the eastern Pacific Ocean and more northerly flow than average over California with resulting cool dry sunny weather over the entire State. February temperatures were much below normal, and precipitation over the State averaged only about 40 percent of normal. Almost the entire month's precipitation occurred in two storms, on the 16th - 17th and the 26th - 27th. Above average sunshine was reported at all stations with the greatest anomalies occurring in northern California with almost 150 percent of the average amount reported at Eureka. Although the cool dry sunny weather was favorable for outside activities the below normal temperatures slowed the growth of most vegetation. Temperatures were too cool for normal development of California citrus crops with frost protection operations required on several nights during the month.

A storm moving eastward across the northwestern United States caused moderate precipitation in northern California on the 1st, with weather clearing on the 2nd as the Pacific High moved eastward over the western states. Clear cool weather generally prevailed over the State the remainder of the first week with mean temperatures rising above normal the second week in the month. Clear conditions continued until the 16th and 17th when, under westerly and southwesterly flow in advance of a cold front moving across the State, general precipitation occurred over the State. The heaviest precipitation occurred in the southern Sierra with the California maximum 24-hour precipitation for the month, 5.57 inches, falling on the observational day ending the 17th at Giant Forest. Strong gradient behind the cold front caused high northerly winds in valleys aligned in a northerly direction; Santa Ana winds at Fontana Kaiser reached a maximum speed of 84 m.p.h. on the 18th while at the Los Angeles Airport a fastest mile of 38 m.p.h. from the north was recorded, and at Santa Monica some trees were blown down. The winds on the 18th also caused damage to antennae installations at Los Banos and Newman, to power lines at Newman, and slight damage to TV antennae and some roofs at Inyokern. Clear cool weather following the cold front passage continued from the 18th through the 24th. A cold front moved southeast across California on the 25th and 26th causing moderate to heavy precipitation over the State. Hail fell at Santa Rosa, Ferguson Ranch, and St. Mary's College on the 27th and heavy snow fell in the Sierra. At Sierra City 22 inches of snow fell on the 27th bringing the snow depth to 31 inches and closing State Highway 49 to traffic for about 12 hours. At Strawberry Valley 30 inches of snow falling with high winds on the 27th closed roads to all but four wheel drive equipment, caused power failures and caused schools to be closed two days. The winds and snow also downed power lines at Placerville and telephone lines at Foresthill Ranger Station. At Wheeler the observer reported the snowfall of the 26th and 27th the "greatest remembered or recorded". Thunderstorms were recorded at Pit 5 on the 25th and 26th and at Santa Cruz on the 27th. Hail was observed at Lodi and Elliot on the 27th. Clearing weather in the cold air behind the front resulted in much below normal temperatures over most of the State the last day of February, temperatures at Mt. Shasta and Blue Canyon averaging 15° or more below normal. At Red Bluff the minimum of 25° was the lowest temperature of record for so late in the season and caused some damage in early variety almonds. The lowest observed February 1955 temperature in California also occurred on the 28th when -25° was recorded at Boca.

Temperatures generally ranged below normal in California except in the period from the 7th through the 17th in which period February maximum temperatures were reached. The highest temperature reported during the month was 87° reached on the 15th at Palm Springs, Blythe, and Excondido Church Ranch. February minimum temperatures generally were reported either in the first week or at the end of the month. The lowest temperature recorded in February was -25° at Boca on the 28th. An above normal number of days with freezing temperatures also occurred during the month. At Fresno the temperature dropped to 32° or lower on 13 days during the month for the greatest number of days on record.

All but the San Joaquin Drainage Division received less than half of the February normal precipitation, the San Joaquin Valley receiving about 60 percent of the normal February total. The North Coast and Southeast Desert Divisions were the driest Divisions receiving less than a third of the normal February precipitation. At Mount Hebron the observer reported the soil moisture the lowest he has seen in his 49 years of residence. Almost all of the precipitation received in the State during the month occurred in two periods, on the 16th - 17th and on the 26th - 27th, the greatest February 24-hour precipitation of 5.57 inches occurring at Giant Forest on the 17th. The greatest monthly total precipitation, 8.97 inches, was also recorded at Giant Forest. The downward trend of runoff continued in northern California and overall storage in reservoirs remained below normal. Heavy snowfall from the storm on the 26th and 27th, however, considerably helped the water supply picture leaving a large deposit of snow extending down to about the 3,500 ft. elevation. The snow pack at Norden near Donner Summit was reported as 86 inches at the end of the month, only 7 inches below normal for the season at the end of February. The greatest snow depth on the ground at the end of February in California was recorded at Soda Springs with a depth of 106 inches, and the greatest February snowfall was reported at Sagehen Creek where a total of 50.5 inches fell during the month.

In the north and central coastal areas the cool dry weather retarded the growth of ranges, winter grains and cover crops.

In the upper Sacramento Valley, due to past cold weather, buds on fruit trees were about three weeks late in early February. Dry weather was generally favorable for outside activities, and fields were about dry enough by mid-month to support heavy farm equipment. Below freezing temperatures on the 28th resulted in some orchard heating of almonds which were in the blossom stage. At Mount Shasta, dry and snow free conditions enabled the logging industry to begin operation much earlier than usual.

Winter vegetables, grain and pastures were also growing slowly in the lower Sacramento Valley but the above normal temperatures experienced the second week of the month helped barley, other grains and pastures to make satisfactory growth during the month. The dry weather was favorable for outside activities and farm work made normal progress.

Cold foggy weather in the lower San Joaquin Valley the first week of February continued to retard pastures and winter grains as well as the completion of the cotton harvesting, but the above normal temperatures from the 10th - 17th and the rains of the 16th - 17th were beneficial for the growth of all crops, swelling buds of almonds and early peaches to near the blossom stage. Below normal temperatures the last decade of the month again slowed the growth of crops.

In the upper San Joaquin Valley low temperatures made heating necessary in the Jasmin area where celery was being harvested the first week of February. Heavy soils, previously too wet for potato harvest, were dry enough in the second week to permit these activities. At Lindsay low temperatures during the month caused considerable replanting of early tomatoes. Weather was generally ideal for all crops the last two weeks except that range grasses were in need of more moisture.

In the Santa Maria area cold dry weather slowed the growth of crops in general with slight frost damage to artichokes the first week of the month. The rains of the 16th - 17th were very beneficial to range grasses. Several light frosts occurred in the last week but no damage was reported to crops.

In the Los Angeles area low humidities and cold nights were generally unfavorable for most crops with light to moderate frosts in citrus areas requiring moderate firing of orchard heaters on the mornings of the 4th and 5th. Warm weather during the middle of February and rain near the middle and end of February benefited most crops although light frost occurred in the Los Angeles area on several mornings in the February 19th - 24th period.

February precipitation in the San Diego area was extremely beneficial for all vegetation but the below normal temperatures resulted in slow growth of crops and some damage to tender vegetation.

In the Imperial Valley weather conditions were generally favorable for crops although there was some wind damage to cantaloupe and watermelon plants.

Robert F. Dale

REFERENCE NOTES

The four digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the 4-standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 1 30 a.m. PST, except for Bishop WB AP which is 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations, consequently occasional drifting and other causes of small variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

Thermometers are exposed on roof.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CLIMATOLOGICAL DATA

CALIFORNIA

MARCH 1955
Volume LIX No. 3

ASHEVILLE: 1955

WEATHER SUMMARY

As in February the mean March flow pattern (or the prevailing air flow at about 10,000 feet) showed higher than normal atmospheric pressure over the eastern Pacific Ocean, below normal pressure over the northern United States and Canada and more northerly flow than normal over northern California resulting in generally clear dry weather over the State. It was one of the driest Marches of record in California, and most agricultural crops suffered from lack of moisture. The U. S. Geological Survey Water Resources Review for March 1955 showed runoff deficient throughout the State, and key wells were reported at a record low for March. Temperatures averaged below normal in northern California, above normal in the South Coast Drainage District, and generally near normal in the remainder of the State. Sunshine was much above normal over the State and March was one of the sunniest on record in the Central Valley.

March precipitation was below normal at every weather station in California except Tracy Carbona where a downpour of 1.67 inches (0.75 inch of this amount falling in 20 minutes) on the 10th brought the monthly total slightly above normal. The wettest areas, both in regard to total amount and percentage of normal, were found in the extreme northwestern and northeastern corners of the State where precipitation averaged about 50 to 60 percent of normal. Precipitation averaged between 25 and 50 percent of normal in the Coastal Range and Sierras of northern California and less than 25 percent of normal in the remainder of the State. The greatest deficiencies were observed generally at stations in the Central Coast Drainage and Southeastern Desert Basins where less than a tenth of the normal precipitation was recorded. At 38 stations in the State there was no precipitation during the month. The State average precipitation of 0.67 inch was about 20 percent of normal and althouth the State average cannot be directly compared with averages prior to those given before 1949 (which are unweighted) it was probably the driest March in the State since 1926. At Mount Shasta the January-March accumulation of 5.21 inches was the 2nd driest total for that period in 67 years of record; four pre-season brush fires were reported in the immediate vicinity ranging from less than one to more than 40 acres. At Red Bluff the 0.59 inch February and March total was the lowest total on record for this bi-monthly period. It was the fifth driest March since 1850 at San Francisco and the driest since 1934. Bakersfield also recorded March as the driest since 1934. The greatest March precipitation was recorded at Gasquet Ranger Station where the total of 8.16 inches was about 83 percent of normal. The greatest daily precipitation was recorded at Lakeshore where 1.98 inches fell on the 29th. By the end of March only stations above elevations of 5,000 feet in the Sierras reported snow on the ground. The maximum snow depth was recorded at Soda Springs where the snow was 86 inches deep on the 31st.

With the exception of the extreme northern portion of California, in which area temperatures averaged about 2° to 4° below normal, and the South Coast Drainage District, in which temperatures averaged about 1.5° above normal, temperatures averaged from slightly below to slightly above normal. The highest March mean temperature in California was reported at Cow Creek with 67.8°, and the lowest mean, 25.1°, was recorded at Twin Lakes. The highest March temperature was recorded at Mecca on the 26th when the mercury reached 98°. The lowest temperature recorded in the State during March was -15° at Boca on the 1st. Damaging freezes occurred in many portions of the State, generally in the third week of the month. It was the 8th consecutive month with below normal temperatures at Sacramento and the 10th consecutive month at Fresno.

Except for light amounts of rain along the northern California coast on the 1st and 2nd, generally clear skies and below normal temperatures prevailed over the State the first five days with temperatures increasing to above normal the second five days of the month. A cold front moved eastward across the State on the 9th causing the only general statewide rain during the month in the period 8th-10th, in which almost all stations, except those in the Southeastern Desert Basins, received rain. Thunderstorms were recorded at Los Banos Arburua Ranch on the 8th and 9th, at Ukiah, Bullard's Bar Power House, Blue Canyon, Sacramento, Giant Forest, and Lodgepole Ranger Station on the 9th, at Paso Robles and Lake Eleanor on the 10th, and at the University of California Los Angeles and Burbank on the 11th. A "cloudburst" was reported near Shandon in San Luis Obispo County on the 10th which caused considerable erosion. At Bakersfield the 0.25 inch precipitation received on the 10th was the only rainfall received during the month at that station. A cold front moved from northern California on the 11th to the southern border on the 15th, however, rainfall resulted only in the northern portions of the State and in the Los Angeles area where a number of thunderstorms occurred on the 16th. Another cold front moved southeastward across the State on the 19th and 20th but caused only high winds in portions of southern California on the 20th, on which date a sandstorm was reported at Hayfield Pumping Plant and dust storms at Thermal and Lodi. High northwesterly winds damaged TV antennas at Newman. At Inyokern strong winds carried borax dust from the Owens Valley; wind damage to TV antennas and roofs was estimated at $500.00. Santa Ana winds reached 47 miles per hour at Fontana Kaiser on the 20th. Temperatures generally remained below normal from the 12th through the 23rd in which period damaging freezes were reported quite generally over the State. Temperatures were generally above normal from the 24th to the end of the month in which period March maximums were recorded by most stations in the State. A weather front moved westward across the State on the 26th and 27th causing the second general rain of the month over the northern half of the State. Another front moved southeastward across the State on the 29th and 30th causing rain and thunderstorms in northern California and a few high winds in southern California. Blowing sand was reported at Cantil 2 E, and at Fontana Kaiser a Santa Ana wind reached 49 miles per hour. Thunderstorms were reported at Eureka and Alturas Ranger Station, and hail at Alderpoint, Tulelake, Westwood 3 WSW, and Blue Canyon on the 29th.

Above the usual amount of sunshine was received in March with the greatest anomalies occurring in northern California and in the San Joaquin Valley where sunshine hours totalled about a third greater than normal. At Fresno 93 percent of the possible sunshine was measured for the highest March amount on record at that station. The 84 percent of the possible sunshine recorded at Sacramento was the greatest March amount since 1908. Wind speeds averaged greater than normal at Red Bluff and Sacramento in the Sacramento River Valley but were generally near or below normal in other portions of California.

Although the dry sunny weather was very favorable for agricultural field work during March the inadequate rainfall and drying winds were unfavorable to pastures, ranges, and dry land grains over all of California. In the San Diego area the drought caused grain crops to head at a height of only four inches, and many farmers turned livestock into fields for pasture. The lack of rainfall and drying winds were also unfavorable to California citrus crops, and there were nights cold enough to cause frost injury in unprotected groves. In the lower Sacramento River Valley, however, the dry weather had some favorable effects in preventing fungus diseases on almonds and apricots. Below freezing temperatures in the third week caused frost damage to apricots and almonds in unprotected low districts in Monterey County, to peaches and almonds east of the Sacramento River, extensive crop damage in some areas of the lower San Joaquin Valley northeast of Stockton, and considerable frost damage to almonds in the Santa Maria area. Only in the Imperial Valley was March weather regarded as generally favorable for crops.

Robert F. Dale

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the station index are assigned [illegible]

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and [illegible]

Observation times given in the station index are in local standard time.

Delayed data and corrections will be carried [illegible] in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be published [illegible] of this bulletin.

Stations appearing in the index, but for which data are not listed in the tables, are [illegible] too late to be included in this [illegible]

Unless otherwise indicated, dimensional units used in this bulletin are [illegible] daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter [illegible]

Sleet and hail were included in snowfall averages in Table 1, beginning January 1941.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24-hour [illegible] time of observation. See [illegible] Table 1 [illegible] time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau [illegible] For these stations [illegible] PST, [illegible] is 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m. PST. WIR EQUIV. [illegible] of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are [illegible] in the snowpack result in apparent inconsistencies in the record.

No record in Tables 3, 6, 7 and the Station Index. No record in Table [illegible] indicated by [illegible]

▲ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

Thermometers are exposed on roof.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after [illegible]

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter C indicates recorder stations. [illegible] are [illegible] published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of [illegible]

M One or more days of record missing, see Table 5 for detailed daily record. Degree Day data, if carried for this station, [illegible] been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published [illegible] the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means "sunset."

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription [illegible] the Annual Summary.) CLIMATOLOGICAL DATA

CALIFORNIA

APRIL 1955
Volume LIX No. 4

ASHEVILLE: 1955

WEATHER SUMMARY

The April mean flow pattern (or the prevailing air flow at about 10,000 feet) showed a low pressure trough extending southeastward along the Pacific Coast from Alaska into the northwestern United States with more northwesterly than normal flow of cold air over California. As a result April was one of the coldest months of record in California. The first half of the month was dry but heavy precipitation the second half of April brought the State average precipitation about one-third above the April normal. Cloudiness showed a similar pattern, with the first half of the month being sunny and the second half cloudy. Wind speeds averaged above normal at all stations except Eureka and Fresno with considerable wind damage reported during the month. The rains brought much needed moisture to dry land crops, pastures, and ranges but in some more southern areas the rain was considered too late for any general benefit to grain crops and pastures.

The month started with a cold front moving eastward across the State on the 1st and 2d, which, coupled with an intense Low developing over Nevada and Utah, caused unusually high winds and considerable resulting damage over much of the State. A description of the wind damage is carried below under Severe Storm of April 1 - 2. Hail was reported at Eureka on the 1st and Ukiah on the 2d. Cold northerly flow over the entire State caused generally below normal temperatures the first five days of the month with most stations in the State reporting April lows occurring in this period. Thunderstorms occurred at Long Beach and Tejon Rancho on the 4th. On the 6th the State Climatologist reported, "a severe whirlwind, described by newspapers and local residents as a 'twister' or a 'baby tornado' which struck the residence of W. P. Edwards, 6539 Etiwanda Avenue, Mira Loma. The whirlwind was observed by Joan Boyd who lives about 100 yards north of the Edwards' residence. The whirlwind formed over a small farming community on level land. It traveled about one mile in a northwesterly to southeasterly direction over a path about 50 yards in width. The time of beginning was reported as 1:30 p.m. and ending at 1:32 p.m. The whirlwind left three gaping holes in the tile roof of the Edwards' home, with damages estimated at $357. There was no wind reported until the whirlwind formed under clear-sky conditions." A cold front moved southeastward across the State on the 9th and 10th causing high winds in southern California and hail at Strawberry Valley and Tulelake Field Station in northern California. The State Climatologist reported, "Strong northwesterly winds with speeds estimated up to 50 m.p.h. on April 10 - 11 left a path of destruction in the Los Angeles area and caused damages estimated at more than $20,000. At least five automobiles were wrecked, scores of trees were uprooted, and electrical service was disrupted in many districts. In the San Fernando Valley two airplanes which were tied down were overturned and damaged. Drifting sand and blowing dust made travel difficult in desert areas. Blowing dust created problems for automobiles and planes in the vicinity of Los Angeles International Airport. Temperatures rose to much-above normal and together with falling relative humidities increased foothill fire hazards. At Los Angeles the relative humidity ranged from a high of 41 percent at 6:30 a.m. to a low of 6 percent at 1:00 p.m." On the 17th and 18th a weather front in northern California moved southeastward across the State, causing the first general rain of the month in much of the State and a considerable number of occurrences of hail and thunder on those dates. Probably the most severe hailstorm occurred in Santa Clara County where the State Climatologist reported, "1/2 to 1 inch of hail accumulating on the ground in the Campbell-Cupertino-Willow Glen district of Santa Clara County during a 10-minute period on the 18th, for one of the heaviest hailstorms in years in that area. Hailstones from 1/4-inch to 1/2-inch in diameter damaged apricots, strawberries, prunes, cherries and other crops. The path of destruction was about 15 miles long and 2 - 3 miles wide. In the Willow Glen district, near San Jose, the storm occurred from about 8:35 a.m. to 8:47 a.m. and moved from west to east. A severe thunder and hailstorm hit about four miles northeast of Red Bluff from about 4:30 a.m. to 5:30 a.m. on the 18th. Hailstones of 1/2 to 5/8-inch in diameter were reported. Hail also occurred in other districts surrounding Red Bluff; however, much of it was reported as soft hail of small size. At Anderson a thunderstorm deposited about three inches of hail. At lower elevations in the upper Sacramento Valley, precipitation occurred chiefly as soft hail and rain while at higher levels it was chiefly snow. In the Sacramento district a severe hailstorm occurred at about 1:30 p.m. on the 18th; however, only 'rice' hail was reported in fruit districts. A hailstorm occurred about 3:00 p.m. April 18 in the vicinity southeast of Biola, Fresno County, California, overspreading a path three miles long and 1-1/2 miles wide. Hail fell generally for about five minutes with hailstones reported as large as 1/4-inch in diameter. Some crops were damaged; however, the extent of the losses was undetermined." A severe windstorm, reported as a tornado, was reported to have wrecked a barn at the McCurry Ranch four miles north of Le Grand. Temperatures were unusually cold on the 18th and 19th. At Fresno the minimum of 35° on the 19th wa the lowest ever recorded for so late in the season. A col front moved southeast across the State on the 23d to 25t which, coupled with a Low developing over Nevada on the 24t and moving slowly north to Idaho on the 26th, caused hig winds and rain over most of the State on the 25th and 26t and hail at many stations. The State Climatologist reported "Strong winds, rain and scattered hailstorms occurred in th San Francisco Bay area on the 25th. In the Half Moon Ba area on the coast, hail caused considerable damage to peas In other north coastal districts strong winds caused consid erable damage to personal property, utility installations and trees. Blunt's Reef Lightship reported wind speeds a high as 60 m.p.h." Damaging winds were reported at Cabazo and blowing sand at Cantil 2 E on the 24th. High winds an blowing sand were reported in the Southeastern Desert Basin on the 25th. At Lake City winds blew limbs from trees an damaged some roofs becoming a regular blizzard with hail o the 25th and 26th. A snowstorm was reported at Alturas and at Lake Spaulding heavy snowfall and high winds close roads. Temperatures, consistently below normal the las half of the month over the entire State, dropped even lowe behind the cold front with freezing temperatures and consid erable crop damage reported in many sections of the State At Mount Shasta the 14° minimum was the coldest ever record ed for so late in the spring and the freeze was thought t have completely destroyed the fruit crop north to the Orego border. The 32° at Red Bluff and the 36° at Bakersfiel also established new record lows for so late in the sprin at those stations. The last cold front of the month move southeastward across the State on the 28th and 29th, and Low developing over Nevada on the 29th caused heavy rain i the coastal sections of southern California at the end o the month.

April temperatures averaged much below normal over th entire State. With the exception of the period from the 5t through the 10th, and in the Sandberg-Los Angeles area fro the 5th through the 15th, temperatures were generally belo normal throughout the month. The greatest departures fro normal were found in northern California where temperature averaged from 6° to 8° below normal. With the exception o the immediate coastal areas and portions of southern Calif ornia where temperatures were less than 4° below normal April mean temperatures in the remainder of the State gen erally averaged between 4° and 6° below normal. At Sa Francisco it was the coldest April since 1901, and at Sant Maria since 1919. At Fresno the cool days and cold night made April the second coldest on record and only 0.1° warm er than the coldest April recorded in 1896. It was the e leventh consecutive month with below normal temperatures a Fresno and the ninth consecutive month at Sacramento. A Red Bluff the April mean temperature was the coldest on rec ord, and the average minimum for the five months ending wit April was 3.9° below normal. The greatest departure fro normal was recorded at Twin Lakes where the April mean o 25.4° was the lowest April mean in the State, about 10° be low normal. Twin Lakes also reported the State minimum tem perature for the month with -7° on the 27th. The highes temperatures were observed in the Southeastern Desert Basin Division with Cow Creek recording the highest April aver age temperature of 73.5°, which was almost 4° below normal The highest temperature recorded in California during th month was 96° at Indio U. S. Date Garden on the 11th ar 12th.

Precipitation was above normal in all but the southeast ern desert area and north along the Nevada border to Bridge port, the extreme upper San Joaquin Drainage basin and a elongated area from Yreka and Fort Jones to Doyle where be low normal precipitation was received. Precipitation wa near normal in the Bay area and was generally much abov normal in the remainder of the State. More than twice th normal April precipitation was recorded in the coastal dis tricts from Eureka to Cloverdale, Ben Lomond to Point Pied ras, and from Santa Barbara to Los Angeles. There were als isolated stations in the Sacramento and San Joaquin Valley which received more than twice the normal April precipita tion. Although the greatest precipitation anomalies wer found in the Santa Barbara-Santa Paula area, where Apri precipitation was nearly four times the normal, the great est April total was reported at Cazadero with a total o 13.86 inches during the month. The greatest observation day precipitation recorded in the State during the mont also occurred at Cazadero when 4.85 inches of rain fell o the 20th. The driest area was the Southeastern Desert Basin Division where zero precipitation was reported for April a 14 stations. The spring precipitation deficiency general extended through the first half of the month with almost al of the April precipitation occurring from the 16th throug the end of the month.

The combination of above normal precipitation and belo normal temperatures resulted in much above normal snowfall in the Sierras. The greatest April snowfall was record

WEATHER S[illegible]

at Blue Canyon with 81.2 inches and at Twin Lakes with 81.0 inches. The 40.1 inches of snow which fell during the last half of April at Mount Shasta was by far the greatest ever recorded so late in the spring. The snowpack at Norden was reported by Sacramento WBO as increasing from 19 inches on the 17th to 75 on the 27th for the greatest gain so late in the season since records began in 1900. At the end of April generally the only snow remaining on the ground was reported at stations above 5000 feet in the Sierras. The greatest depth on the ground at the end of the month was recorded at Soda Springs with 80 inches.

Reports from the State Climatologist indicated that although the rains benefited many crops and improved the moisture outlook considerably the rains were too late for any general benefit to grain and hay crops in the San Diego, Los Angeles, and upper San Joaquin Valley areas. The heavy rains also helped greatly to improve range and pasture feeds over most of northern California, but in southern areas and on the lower foothill areas in the San Joaquin Valley considerable early feed was too mature to respond to rainfall. The California Crop and Livestock Reporting Service reported the average condition of pasture and range feed on May 1 as 66 percent compared with 90 percent last year and the 10-year average of 76. The California Crop and Livestock Reporting Service also reported, "Rains during the month brought much-needed moisture to dryland barley, wheat, oats and grain hay. The rains, however, made it necessary to replant some cotton, damaged some cut hay still in the field and delayed field work for spring crops. It was too cold for favorable development of alfalfa and irrigated pastures, and sustained below normal temperatures prevented normal germination of newly seeded rice and cotton."

There was considerable freeze damage to California deciduous fruit and nut crops during the month with damage ranging from light to complete loss of individual crops in some areas. The cold period from the 2d to 4th was disastrous to the almond, prune, apricot, and peach crop in many parts of Tehama County, caused extensive damage to fruit and nut crops in the lower Sacramento Valley, some damage to grapes in the lower San Joaquin Valley and heavy loss in deciduous fruit in the Beaumont district. Low temperatures on the 14th and 15th caused considerable damage to prunes in Napa County, light damage to tomatoes in Sacramento County, and to walnuts, almonds, and prunes in Yolo County. The freezing temperatures of the 19th caused heavy damage to cherries and slight damage to apricots in Monterey County. On the 27th frost damage was reported in Sonoma, Lake, and Santa Clara Counties, and freezing temperatures necessitated orchard heating in the upper Sacramento River Valley and caused some damage to orchards and tomatoes in the lower Sacramento Valley. The freeze nipped some potatoes and cotton in the upper San Joaquin Valley and caused scattered frost damage in the lower portions of the valley. Hail and wind also caused some crop damage during the month.

SEVERE STORM OF APRIL 1 - 2

The following report was prepared by the California State Climatologist: "One of the worst dust and windstorms in recent years struck the San Joaquin Valley on April 1, 1955, resulting in widespread damage. Numerous trees were blown over. Countless television antennae were twisted and blown from buildings, electrical service was disrupted in many districts, and some crops were damaged. The southeastern portion of Tulare County was hit extremely hard by the brief but violent windstorm. Strong winds persisted from two to four hours during the early evening. Strong northwesterly winds with speeds from 40 to 50 m.p.h. and gusts reaching 80 m.p.h. were reported due to the development of an intense Low over Nevada and Utah. At Bakersfield, the visibility was reduced to almost zero by a severe duststorm. In the Exeter district strong winds caused considerable damage to trees and television antennae. Some damage was reported to fruit crops in the Visalia district. Strong winds from about 6:30 p.m. to 8:00 p.m. caused extensive damage to fruit trees. Considerable cotton seed was eroded from the soil and blown away by the winds. In other instances cotton which had just emerged had tops blown off while some cotton was buried by drifting sand and soil. Some damage to automobiles was reported from falling limbs.

"In Los Angeles County, the storm was described as one of the worst windstorms ever recorded in April. Gusts estimated up to 50 m.p.h. downed hundreds of trees, signboards, utility poles, and television antennae. A number of people perished when their small boats capsized. Others were rescued when their boats were damaged or overturned by the wind. An 18-foot boat was wrecked at Redondo Beach, and at Santa Monica a small airplane was blown from the field and wrecked. Gales blew in the San Fernando Valley and most of Los Angeles. In desert regions winds up to 55 m.p.h. sent huge masses of sand and dust across highways slowing traffic and making driving conditions extremely hazardous."

R. F. Dale

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a [illegible] basis. [illegible] to identify [illegible] within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement [illegible] daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observa[illegible]

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 [illegible] is 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is [illegible] of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

CALIFORNIA

MAY 1955

Volume LIX No. 5

ASHEVILLE: 1955

WEATHER SUMMARY

May weather was characterized by a precipitation pattern reversed from the normal one, with southern California receiving more rainfall than northern California. Rainfall averaged greater in the Southeast Desert Basins, usually the driest area in California, than in the North Coastal Drainage, normally the wettest in the State. Many stations in northern California received no measurable precipitation during the month while many stations in southern California, principally in the Los Angeles area, received in excess of four times average May rainfall totals. Temperatures were generally near to below normal over the State with the greatest departures occurring in southern California where temperatures averaged generally 2° to 4° below normal. After an unusually cold April the near normal May temperatures and generally above normal sunshine were welcomed by agriculturists; rainfall during the month was beneficial; and the month was generally regarded as favorable for all vegetative growth.

The month started with northerly flow of cold air over California behind a Low over the western United States with unseasonal and widespread thunderstorms over southern California. The State Climatologist reported, "locally heavy precipitation of cloudburst proportions in some districts, hail, heavy snowfall in mountains, with amounts as great as 30 inches in some places, and strong winds which toppled trees and damaged property. Many fishermen who ventured out for the opening of the trout season were marooned by the heavy rains and snow and had to be rescued." Many stations in the State, but primarily in the southern half, recorded greatest 24-hour rainfall of the month and May low temperatures the first two days. A Low formed over southern California on the 6th and moved northward into Nevada on the 7th causing considerable thunderstorm activity and several occurrences of hail primarily in southern California and north in the Sierras to Truckee Ranger Station and Twin Lakes. In this period greatest 24-hour precipitation amounts were recorded at most stations in the northern five divisions. The State Climatologist reported: "A pelting rainstorm in the Pajaro Valley and Santa Clara County on the 7th resulted in serious losses to strawberries. Hard rains damaged strawberry plants and splashed mud on berries making them unsuitable for the fresh market. A severe rain and hailstorm also struck the Alpaugh district on the 7th causing extensive damage to crops. In a period of 20 minutes it was reported a total of 1-1/8 inches of precipitation occurred. The main streets of Alpaugh were running full of water. Cotton fields with newly-sprouted plants were inundated in many places. Hail the size of large peas covered the ground like a blanket of snow. Most of the cotton plants were stripped of leaves and replanting was required. In one barley field virtually all heads were knocked down. The hay that was down sustained a considerable loss." Mean daily temperatures rose slowly from generally much below normal on the 1st to slightly above normal by the 10th and 11th. A cold front moving southeastward across the State on the 12th and 13th caused temperatures to drop below normal in the period 13th through the 16th reaching May lows at many stations. With high pressure over the northwestern United States from the 17th through the 19th temperatures generally ranged near 10 or more degrees above normal over the State, with May highs recorded at most stations in the State in the period 18th to 21st. The State Climatologist reported: "Hot desert winds with relative humidities lower than 20 percent in some places and peak wind speeds of 50 - 60 m.p.h. increased fire danger in the San Gabriel Valley to a high level May 18, 1955; the strong winds toppled trees and power lines in foothill areas." A storm developing over the Southeast Desert Basins and Nevada on the 25th caused high winds in the Imperial Valley and considerable thunderstorm and hail activity on the 24th and 25th in the northern Sierras. At Brush Creek Ranger Station about two inches of hail accumulated on the ground. At Sacramento a squall line was reported to have formed in the Marysville area on the 24th and moved southward past Sacramento and Lodi accompanied by strong gusty winds but negligible rain. The State Climatologist reported, "strong winds with gusts up to 55 m.p.h. lashed the Imperial Valley leaving a widespread area of tangled television antennae, and littered streets and yards." A Low developing over southern Nevada on the 30th and 31st caused high winds and scattered thunderstorm and hail activity over most of the State on the 31st. The storm also caused several inches of snow over the Sierras above 4,500 feet and greatest 24-hour precipitation totals at some stations in southern California.

Temperatures generally averaged below normal over the entire State except in western portions of the Sacramento and San Joaquin Drainage where temperatures were near to slightly above normal. The coldest area relative to normal was found in southern California; temperatures averaged generally 2° to 4° below normal at most stations in the Southeast Desert Basins. At Fresno May was reported as the 12th consecutive month with below normal temperatures. The month, however, averaged slightly warmer than normal at Red Bluff for the first time since May 1954, and at Sacramento since July 1954. At Santa Maria the mean May temperature was the lowest in 13 years of record at the airport location and the lowest May temperature of combined Santa Maria record since 1921. The lowest mean temperature was recorded at Twin Lakes with 36.5°, and the highest monthly mean was 82.8° recorded at Cow Creek. The highest temperature in the State reported during May was 109° reached at Cow Creek on the 20th and 21st and at Greenland Ranch on the 21st. The lowest temperature was recorded at Twin Lakes with 8° on the 3d.

More than twice the normal precipitation was received in the South Coast Drainage, southern portion of the Central Coast Drainage and upper San Joaquin Drainage with more than four times the normal May precipitation received in the Los Angeles area north to Haiwee, and in the King City-Parkfield-Coalinga area with most of the precipitation occurring in the storm at the first of the month. The greatest 24-hour precipitation in the State occurred on the 1st when 3.26 inches fell at Squirrel Inn 2. The greatest May total was also reported at Squirrel Inn 2 with a total of 5.15 inches, more than three times the normal May total for that station. Except in the Sierra precipitation north of the Bay Area generally totalled less than a tenth of the normal May precipitation with many stations reporting no precipitation during the month. The North Coast Drainage Division, normally the wettest division, was the driest in the State with an average precipitation for the division of only 0.06 inch. At Eureka it was the driest May of record, the previous driest being in 1920. At Mount Shasta it was the second driest May since 1924 and the fourth driest since 1888. The only measurable precipitation received at Red Bluff during the month was on the 1st, and at San Francisco it was the driest May since 1938 when only a trace was recorded.

The greatest snowfall recorded during the month was at Huntington Lake with 19.5 inches. Although the greatest snow depth on the ground was measured at Soda Springs on the 1st (78 inches), the only measurable snow still on the ground at the end of the month was reported at Huntington Lake with 3 inches. The Geological Survey Water Resources Review reported: "Runoff and storage in northern California increased greatly as a result of increased snowmelt. In southern California contents of San Diego reservoirs was 10 percent of capacity, but the Santa Barbara County reservoir was 98 percent full. However, the outlook for the next few months is only fair south of Sacramento where storage and cumulative runoff are both considerably below average."

Wind speeds averaged generally above normal at reporting stations in northern California and near to slightly below normal in southern California. Cloudiness was generally above normal at reporting stations in the South Coastal Drainage Division and below normal in the remainder of the State.

The California Crop and Livestock Reporting Service reported: "Weather conditions were favorable for field crops now growing and for farm work in May. Rainfall during the month was beneficial and warmer weather stimulated growing crops and benefited ripening grains. Harvesting of wheat, oats, barley, and flaxseed generally started in May. Seeding of rice is about completed. Cotton planting is almost finished. There was considerable cotton replanted this year because of rains and cool weather earlier in the planting season. The crop is later than last year but the turn to warmer weather in May was highly beneficial. Spring-planted sugar beets are making good seasonal development and the harvest of the fall-planted (Imperial Valley) beet crops is under way. Growers are cutting alfalfa hay in all main districts.

"Marked improvement of range and pasture feeds followed late April and early May rainfall. Some regrowth occurred in areas where feed had matured and the added moisture plus warmer weather brought on good feed development in other areas. Summer ranges are slow in starting because of the extended cold weather during the spring months. The reported average June 1 condition of pasture and range feeds at 77 percent is just one point below average but 11 points below last year's outstanding level.

"May weather (was also) generally favorable for the development of California fruit and nut crops. All crops responded to the warmer (May) weather, and good growth and development has occurred during the favorable period. Several windy days during May caused losses and damage to crops, especially plums in the San Joaquin Valley. The late rains caused the loss of a few early cherries, but were otherwise beneficial."

The State Climatologist reported that cold spells in the Napa Valley during March and May damaged about half of the prune crop and about 20 percent of the grape crop. In the Napa Valley temperatures dropped to 32° or lower on 22 nights from March 14 to May 12 as compared with a 20-year average of only 14 nights according to E. M. Legg, U. S. Weather Bureau. Orchard heating was required on 14 nights to protect crops: the largest number of nights of firing since records began in 1936. Unseasonal, dry, north winds were detrimental to new growth on vines and trees and brought low relative humidities which contributed to the critical minimum temperatures.

REFERENCE NOTES

The four digit identification number in the Index number column of the Station Index are assigned in a [illegible]

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Revised data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, the values and units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a mean annual average of 65 °F.

Evaporation is measured in the Standard Weather Bureau Type pan of 1-foot diameter, unless otherwise noted in the following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation [illegible] the Station Index for that observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations [illegible] is 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent [illegible] of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7 are [illegible] lifting and other [illegible] result in apparent [illegible]

- Not received in Tables 3, 6, 7 and the Station Index [illegible]
- Will be [illegible] on a later date or dates.
* Amounts include, in full, all [illegible] since [illegible].
/ Accumulated [illegible] since [illegible] [illegible] writing.

// Gage is equipped with windshield.

AM Data based on an observational day ending before [illegible]

AR This entry in time of observation column in Station Index means water rate.

B Adjusted to a full month.

' In the "Refer to Table" column in the Station Index the letter 'P' indicates records [illegible] These [illegible] published [illegible] Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the [illegible]

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue [illegible]

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may obtained by writing to any Weather Bureau Office [illegible] Building 50 Fulton Street San Francisco 2, California.

JUNE 1955
Volume LIX No. 6

ASHEVILLE: 1955

CALIFORNIA - JUNE 1955

WEATHER SUMMARY

June was a dry cool month in the State but was generally regarded as favorable for agricultural crops. With the exception of the northeastern corner June mean temperatures were below normal over the entire State, almost all daily mean temperatures generally remaining below normal after the 9th. Only seven stations, generally in the northern mountain area, recorded above normal precipitation during the month, and at 277 stations zero precipitation was reported. Most if not all of the precipitation recorded at many stations fell in the period of scattered shower and thunderstorm activity from the 9th through the 14th. A cloudburst occurring in the Lake City area on the 13th caused damages to roads, crops, and personal property estimated at $100,000. Cloudiness was above normal in the coastal divisions and generally below normal inland. Average hourly wind speeds were well above normal at reporting stations in the Sacramento Drainage but were generally near normal at other reporting stations in the State.

The month started with northerly flow of cool dry air over the State, scattered showers in the Sierras and below normal temperatures over the entire State. The lowest June temperature of the month was recorded at most stations in all divisions on the 1st. Temperatures increased to about 10° or more above normal from the 4th through the 6th in the coastal divisions and from the 4th through the 9th in the inland divisions with almost all stations in the State, except in the South Coast Drainage Division, recording the highest temperatures of the month in these periods. Except for widely scattered thunderstorms in the Sierras on a few days there was no precipitation over the State between the 1st and 9th. A cold front moved eastward across the State on the 9th to 11th which in conjunction with low pressure over Nevada from the 9th through the 16th caused scattered showers and thunderstorms over most of the State in the period from the 9th through the 14th in which period the greatest observational-day precipitation amounts occurred at most stations in the State. The State Climatologist reported: "Lightning caused about 500 fires in forests in northern California.

"A freak cloudburst in the Lake City, Modoc County, California, area on June 13, 1955, caused damage estimated at $100,000 when tons of mud and debris were washed down the mountainside covering the highway for seven miles. The deluge left mud piled six to seven feet deep and in some places alfalfa and grain fields were washed away. Large sections of County Road No. 1 were obliterated and untold damages occurred to fences and personal property. Some residents were forced to abandon their hillside homes as water invaded their dwellings.

"It was reported that a seven mile stretch of cloudburst laid down a torrent of six inches of precipitation in a matter of minutes. Thunder and lightning were severe and hail in amounts six to ten inches in depth at places extended for a half mile up the mountainside. The Weather Observer at Lake City reported the storm as the heaviest that has struck in the valley over as large an area."

Temperatures dropped below normal at most stations in the State on the 10th behind the cold front and continued below normal through most of the rest of the month with the coldest periods generally occurring from the 13th through the 16th and the 26th to 29th when temperatures averaged 10° or more below normal in many areas and a number of stations recorded June lows. A cold front moved southeastward across the State on the 21st to 23d but caused little precipitation except in the North Coast Drainage Division where a few stations recorded greatest observational-day amounts in this period. Large dust whirlwinds were reported at Llano on the 19th and at Graton on the 23d. Another cold front moved southeastward across the State on the 25th causing widely scattered thunderstorm and light shower activity over northern California and in the South Coast Drainage District on the 25th and 26th. At Orinda Bowman high winds on the 25th broke small branches from trees. Another cold front moved southeastward across the State on the 28th and 29th causing light scattered shower activity in northern California. On the 28th a severe whirlwind struck the Ed Newman farm on Road 98 about six miles west of Knights Landing, causing extensive damage to barns and sheds. The State Climatologist reported: "Newman, who was working atop a haystack when the twister struck, lay flat as it passed by and was uninjured. The wind blew chickens into the air, and several thousand bees, which were swarming in one of the trees, were destroyed. Galvanized roofing was torn from the barn, and a cow was injured." On the 29th "killing frost" was reported at Ft. Jones Ranger Station and heavy freezes occurred at Weed and McCloud near Mt. Shasta, frost and ice forming in some of the colder spots in the vicinity of the Mt. Shasta Weather Bureau.

The June mean temperature was below normal over the entire State with the exception of the northern portion of the Sacramento Drainage and in the Northeast Interior Basins. Temperatures over the remainder of the State averaged from slightly below normal to more than four degrees below normal in the Palm Springs and Tehachapi areas. At Burbank the temperature of 44° on the 1st was the second lowest temperature ever recorded in June. It was the 13th consecutive month with mean temperatures below normal at Fresno and the 8th at San Francisco. The lowest temperature recorded in the State during the month was 10° at Twin Lakes on the 1st which was the lowest California June minimum since 1929 and equaled the third lowest California June minimum of record. The highest temperature in the State was recorded at Greenland Ranch with 123° on the 7th.

Precipitation was below normal over the entire State with the exception of a few stations in the northern Sierras, and at Palos Verdes Estates and Cow Creek, the latter station reporting a June total of 0.04 inch. With the exception of the extreme northwestern corner of the State, the Northeastern Interior Basins, and isolated stations, less than a quarter of the normal June precipitation was received. There was no precipitation at all in June at 277 stations with many more reporting only a trace of rainfall during the month. The greatest monthly total was recorded at Lake City with 2.66 inches, 2.11 inches of this amount falling on the observational day ending the 14th.

Reports of the California Crop and Livestock Reporting Service placed most California field crops in generally very satisfactory condition except for retarded growth due to the below normal temperatures in June and this spring. The combined total field crop acreage for harvest in 1955 was estimated at 6,558,000 acres which is about four percent less than the record high in 1954 but about six percent greater than the 10-year average. The cool weather was favorable for some fruit and nut crops but slowed the growth and development of early maturing fruits, and harvest dates are from a few days to as much as two weeks behind normal harvest dates. Generally range feed supplies were reported satisfactory throughout the State, but the early dry spell left some localities with limited amounts. May rainfall was very beneficial in most areas, and late grass in many areas was expected to carry over well beyond the usual time. Irrigated pastures were producing well and grain stubble was being used extensively. High mountain ranges were fair to good. Cattle and calves were doing well on the high quality range feeds. The State Climatologist reported fire danger in forests continued about normal for this time of year. In the Tulelake district below-freezing temperatures resulted in considerable damage to potatoes.

R. F. Dale

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST; Blue Canyon WB AP and Bandberg WB 8:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations, consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

Thermometers are generally exposed in a shelter located a few feet above sod covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

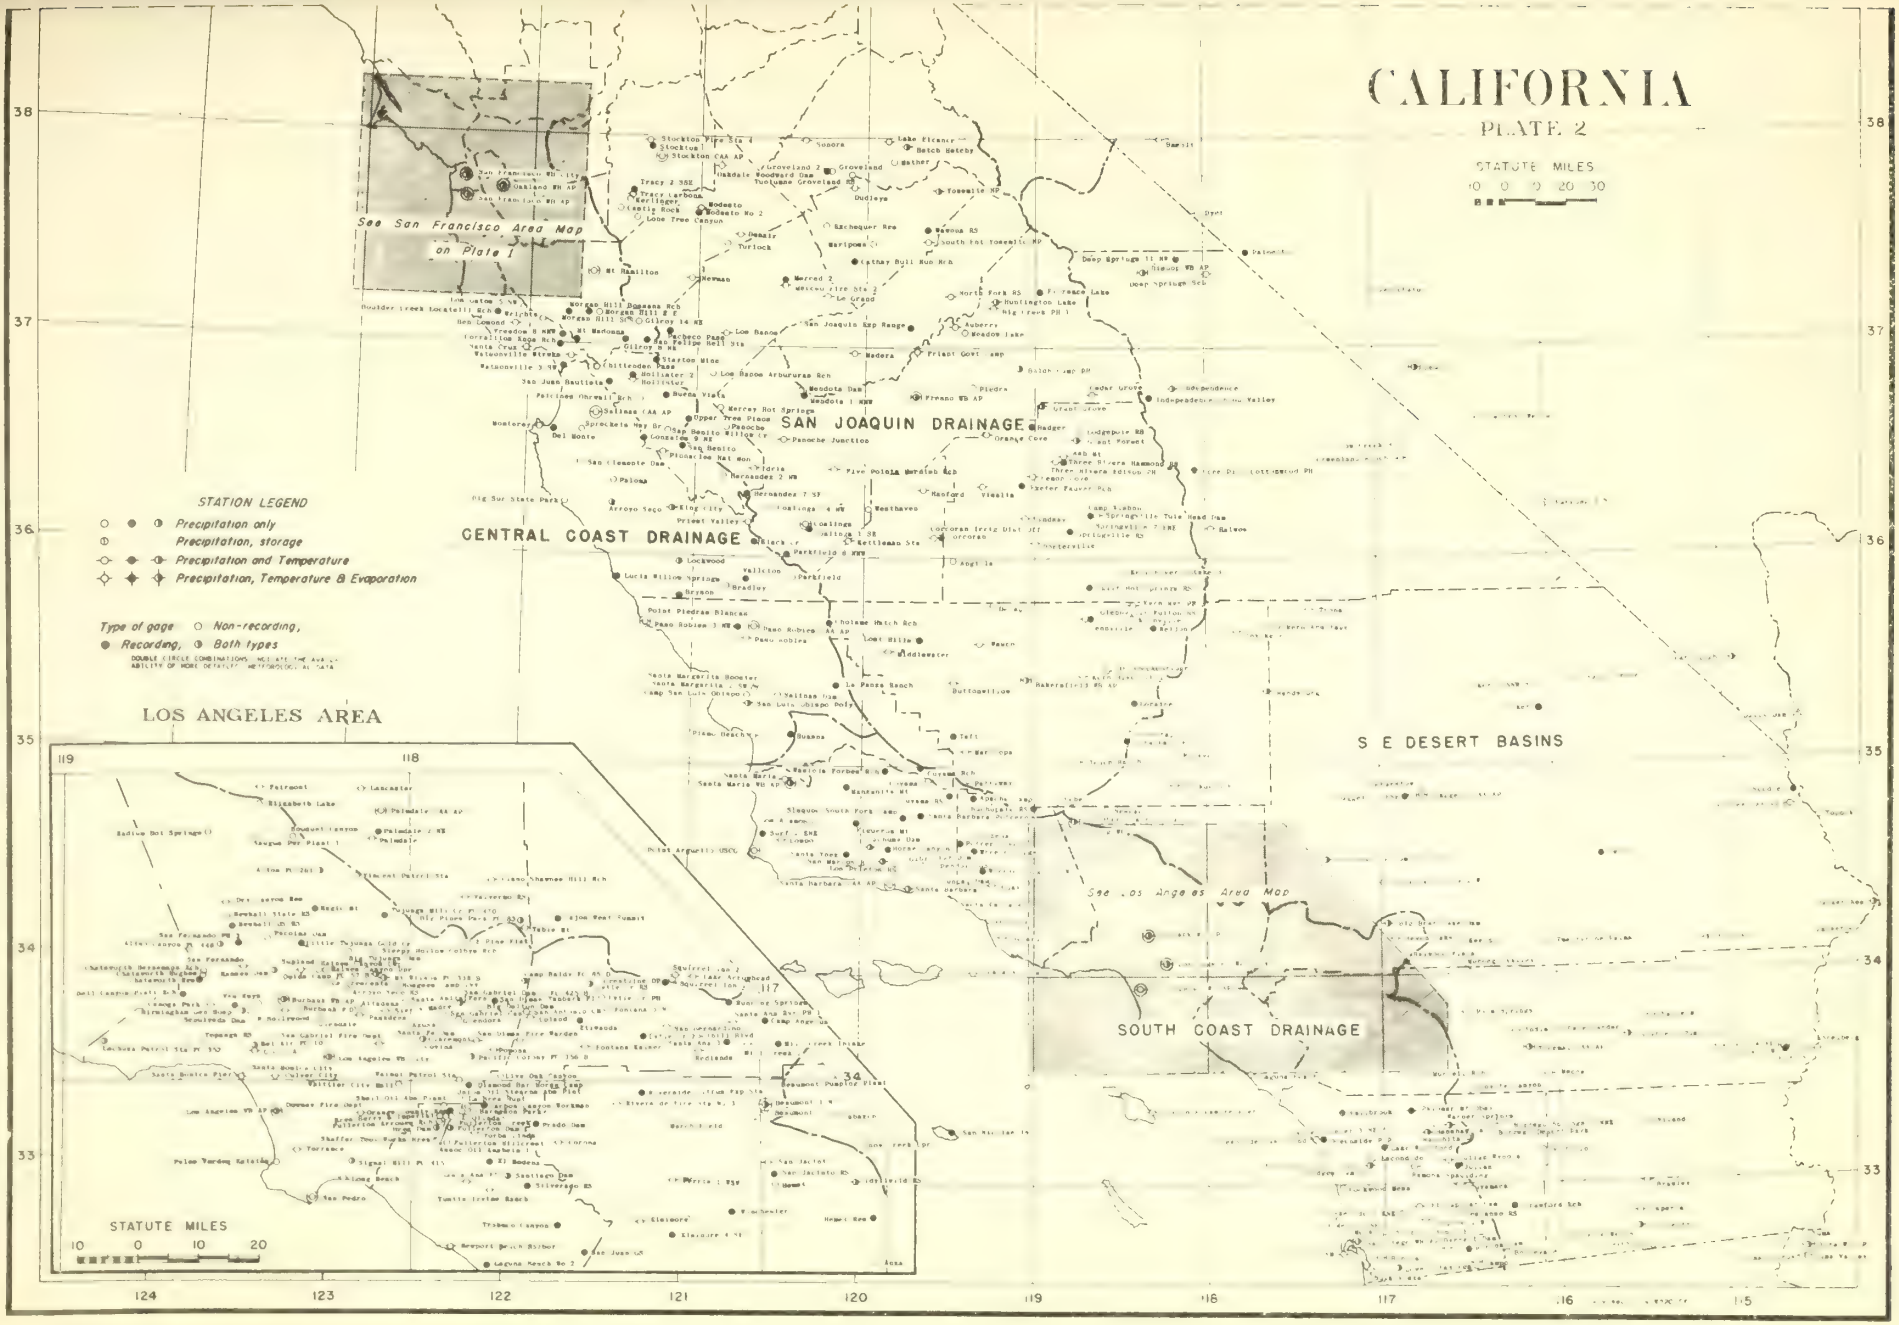
S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.



Additional information regarding the climate of California may obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

JULY 1955
Volume LIX No. 7

ASHEVILLE: 1955

WEATHER SUMMARY

July was cool and typically dry, and was the eighth consecutive month with below normal temperatures. Although thunderstorm and shower activity occurred in isolated areas, and brought the average divisional precipitation to about twice normal in the Northeast Interior and Southeast Desert Basins and the South Coast Drainage, the majority of the State had no rainfall during the month. Thunderstorms in San Diego and Imperial Counties on the 18th and in Mono County on the 21st and 22d caused considerable local flood damage. Cloudiness, sunshine, and wind speeds were generally near normal for the month at reporting stations with the following exceptions: wind speeds were above average in the Sacramento Valley and Los Angeles area, with the average hourly wind speed at Red Bluff reported as the highest on record; above the normal amount of cloudiness was observed in the Los Angeles-San Diego area and in extreme northern California. Although the cool temperatures continued to delay most vegetative growth early in the month July weather was generally considered favorable for agricultural crops.

Under the flow of cool air down the western side of the upper-air Low (500 mb) centered over Washington and Oregon the first ten days of the month temperatures averaged much below normal over the State with almost all stations recording July minimums in this period, and the majority on the 4th, 5th, and 6th when daily mean temperatures were near 10° or more below normal in most of the interior areas and about 5° below normal along the coastal areas. Scattered thunderstorm and light shower activity occurred in the North Coast and Sacramento Drainages, primarily in the mountain areas, from the 2d through the 4th. At Graton freezing temperatures were reported in the valley about four miles east which killed some garden plants. A few scattered thunderstorms were reported in the mountain sections of the Sacramento Drainage on the 9th and 10th. Thunderstorm activity was general in the Sierras in the period 12th to 14th and scattered in the Southeast Desert Basins. The State Climatologist reported a sudden localized wind of short duration on the evening of the 12th in the Fall River-Dana-Glenburn-McArthur area which caused light damage such as broken windows, downed aerials, and uprooted trees. Some damage also occurred to resort installations at Eastman Lake. An upper-air High (500 mb) built over the southwestern United States on the 12th and generally continued to the 26th. Temperatures rose to above normal from the 13th to 15th in which period July maximums were reported at most stations in the State. There was considerable thunderstorm activity in the Southeast Desert Basins from the 18th through the 24th which spread northward into the Sierras on the 21st and 22d. The State Climatologist prepared the following report: "Thunderstorms with attendant strong winds and heavy rains spread some damage in San Diego and Imperial Counties on the evening of July 18th. Power poles were knocked down and areas 'blacked out' in regions around Palm Springs, Camp Irwin, and Barstow, while lightning struck the Gale Substation of the California Electric Power Company in San Bernardino County. Strong winds unroofed two houses and a church and wrecked a business structure in the Borrego Springs area. In Cherry Valley, near Beaumont, many plum trees were knocked down, and countless half-ripened plums were blown from the trees. Several homes were flooded throughout the stricken area, and roads and highways were washed out or inundated. Beaumont Pumping Plant received a 24-hour rainfall of 2.18 inches, and Palm Springs 1.05 inches in the observational day ending on the 19th.

"A gentle summer rain turned into a deluge northwest of Leevining in Mono County on July 21st and again on the 22d, causing landslides that buried automobiles, cabins, and two highways under tons of mud and debris estimated at fifty feet deep in some places. Many vacationing families were marooned by the closing of the two major highways and left without water due to the contamination of streams by mud. The area of heaviest rainfall appeared to be at about the 8,000 foot level northwest of Leevining where no rainfall measurements were available. For the two days Mono Lake reported a total rainfall of 2.78 inches and Ellery Lake 1.90 inches. The observer at Mono Lake reported: 'Heavy rain started about 3:00 p.m. July 21st lasting to around 5:30 p.m. (with a total of 2.50 inches falling in this period). A heavy cloudburst broke over the mountains to the west of Mono Lake coming down all of the canyons, particularly the canyon above Tioga Lodge which suffered immense damage to buildings and grounds estimated at around $150,000, and heavy damage to Highway 120 going into Yosemite Valley from Highway 395. The highway at the lodge was blocked from 4:00 p.m. of the 21st to 3:00 a.m. of the 22d. The heavy damage on 120 was approximately 7 or 8 miles from the junction of 395, with minor damage between. There was some damage to the City of Los Angeles waterworks in the Leevining Canyon and some damage to county roads and to Power Company holdings in the same vicinity. Campers in the same area received some damage to camps and trailers. Several automobiles were carried away, some into Mono Lake. On the 22d another flash flood came down in the same localities about 4:30 p.m. doing more damage to Highway 120 and some more at Tioga Lodge, blocking the highway at the Lodge until around 1:30 a.m. of the 23d. No lives lost and no injuries known.'" Scattered thunderstorms were reported in the Southeastern Desert Basins and at El Capitan Dam on the 31st.

Temperatures averaged below normal over the entire State and much below over generally all but portions of the North Coastal Drainage and Los Angeles-San Diego and Barstow-Twentynine Palms area where temperatures were near to slightly below normal. The coldest areas were in interior portions of northern California extending southward generally along the western slope of the Sierras to the upper San Joaquin Drainage and in the Santa Ana-Indio-Cuyamaca area where temperatures averaged from 4° to 6° below normal. The greatest departures were reported at higher elevation stations, Calaveras Big Trees, Auberry, and Upper Lake Ranger Station with anomalies of -7.8°, -6.7°, and -6.6°. Many stations reported record cold Julys: at Fresno it was the coldest July on record (previous low in 1903) and the 14th consecutive month with mean temperatures below normal; the 21 days with 90° or higher temperature was also the least number of record for July. At Bakersfield it was the coolest July since 1920, and at Santa Maria the coolest in the 13 years of record. At Red Bluff it was the 13th consecutive month with below normal temperatures; daily maximum temperatures did not rise above 93° in the 30-day period from June 10 to July 10, and in this same period records show that in only two other years, 1884 and 1912, did maximum temperatures stay below 100°. It was the ninth consecutive month with below normal temperatures at San Francisco. The highest recorded during the month was 121° at Cow Creek, and the low for the month was reported at Twin Lakes with 20° on the 5th, the lowest July minimum recorded in the State since 1905.

Although light to heavy shower activity occurred in isolated areas of the State, bringing the July State average precipitation above normal, precipitation was typically missing at most stations in July. No precipitation at all was recorded at 324 stations and many more received only a trace. Isolated shower activity brought the average precipitation to about twice the normal in the Northeast Interior Basins, South Coast Drainage, and Southeast Desert Basins. The areas of above normal rainfall were usually dependent upon one or two showers: the 0.26 inch total at Blue Canyon, more than 8 times the average July precipitation, all fell on the 2d; the rains of 2.34 inches at Twentynine Palms, 2.18 inches at Beaumont Pumping Plant, and 1.05 inches at Palm Springs, all measured on the 19th but almost all occurring on the 18th, were also the monthly totals, more than 6 times the normals. The greatest monthly precipitation was recorded at Mountain Pass with 3.36 inches, 1.72 inches of this amount occurring on the 24th. The greatest observational day precipitation was recorded at Mono Lake on the 21st when 2.50 inches of rain fell in a period of about 2-1/2 hours causing the flood conditions described earlier in this summary.

Reports of the California Crop and Livestock Reporting Service indicated conditions were generally favorable for satisfactory development of field crops growing and for harvesting those matured in July. Above average yields were expected for corn, grain sorghums, hops, rice, beans, sugar beets, early and summer potatoes, and cotton. Although early July was too cool for the best growth of cotton and its development was delayed, the warmer weather later in the month was beneficial. Harvesting of wheat, barley, oats grain hay, and flax was about complete in main areas. The combined production of grain crops harvest was a little below last year's record high, because of less acreage and slightly lower yields per acre. The continued cool weather was favorable for some of the fruit and nut crops but slowed the growth and development of those requiring warmer weather for good development. There have been no rains of any consequence in the main fruit and nut areas of the State. The condition of pastures and range feed was reported equal to the 10-year average, and the below normal temperatures helped the quality of dry range feed to hold well. Very little feed was destroyed by range and brush fires this season to August 1. Stockwater supplies showed their usual summer decline with shortages appearing locally.

Robert F. Dale

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letterm following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65 F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

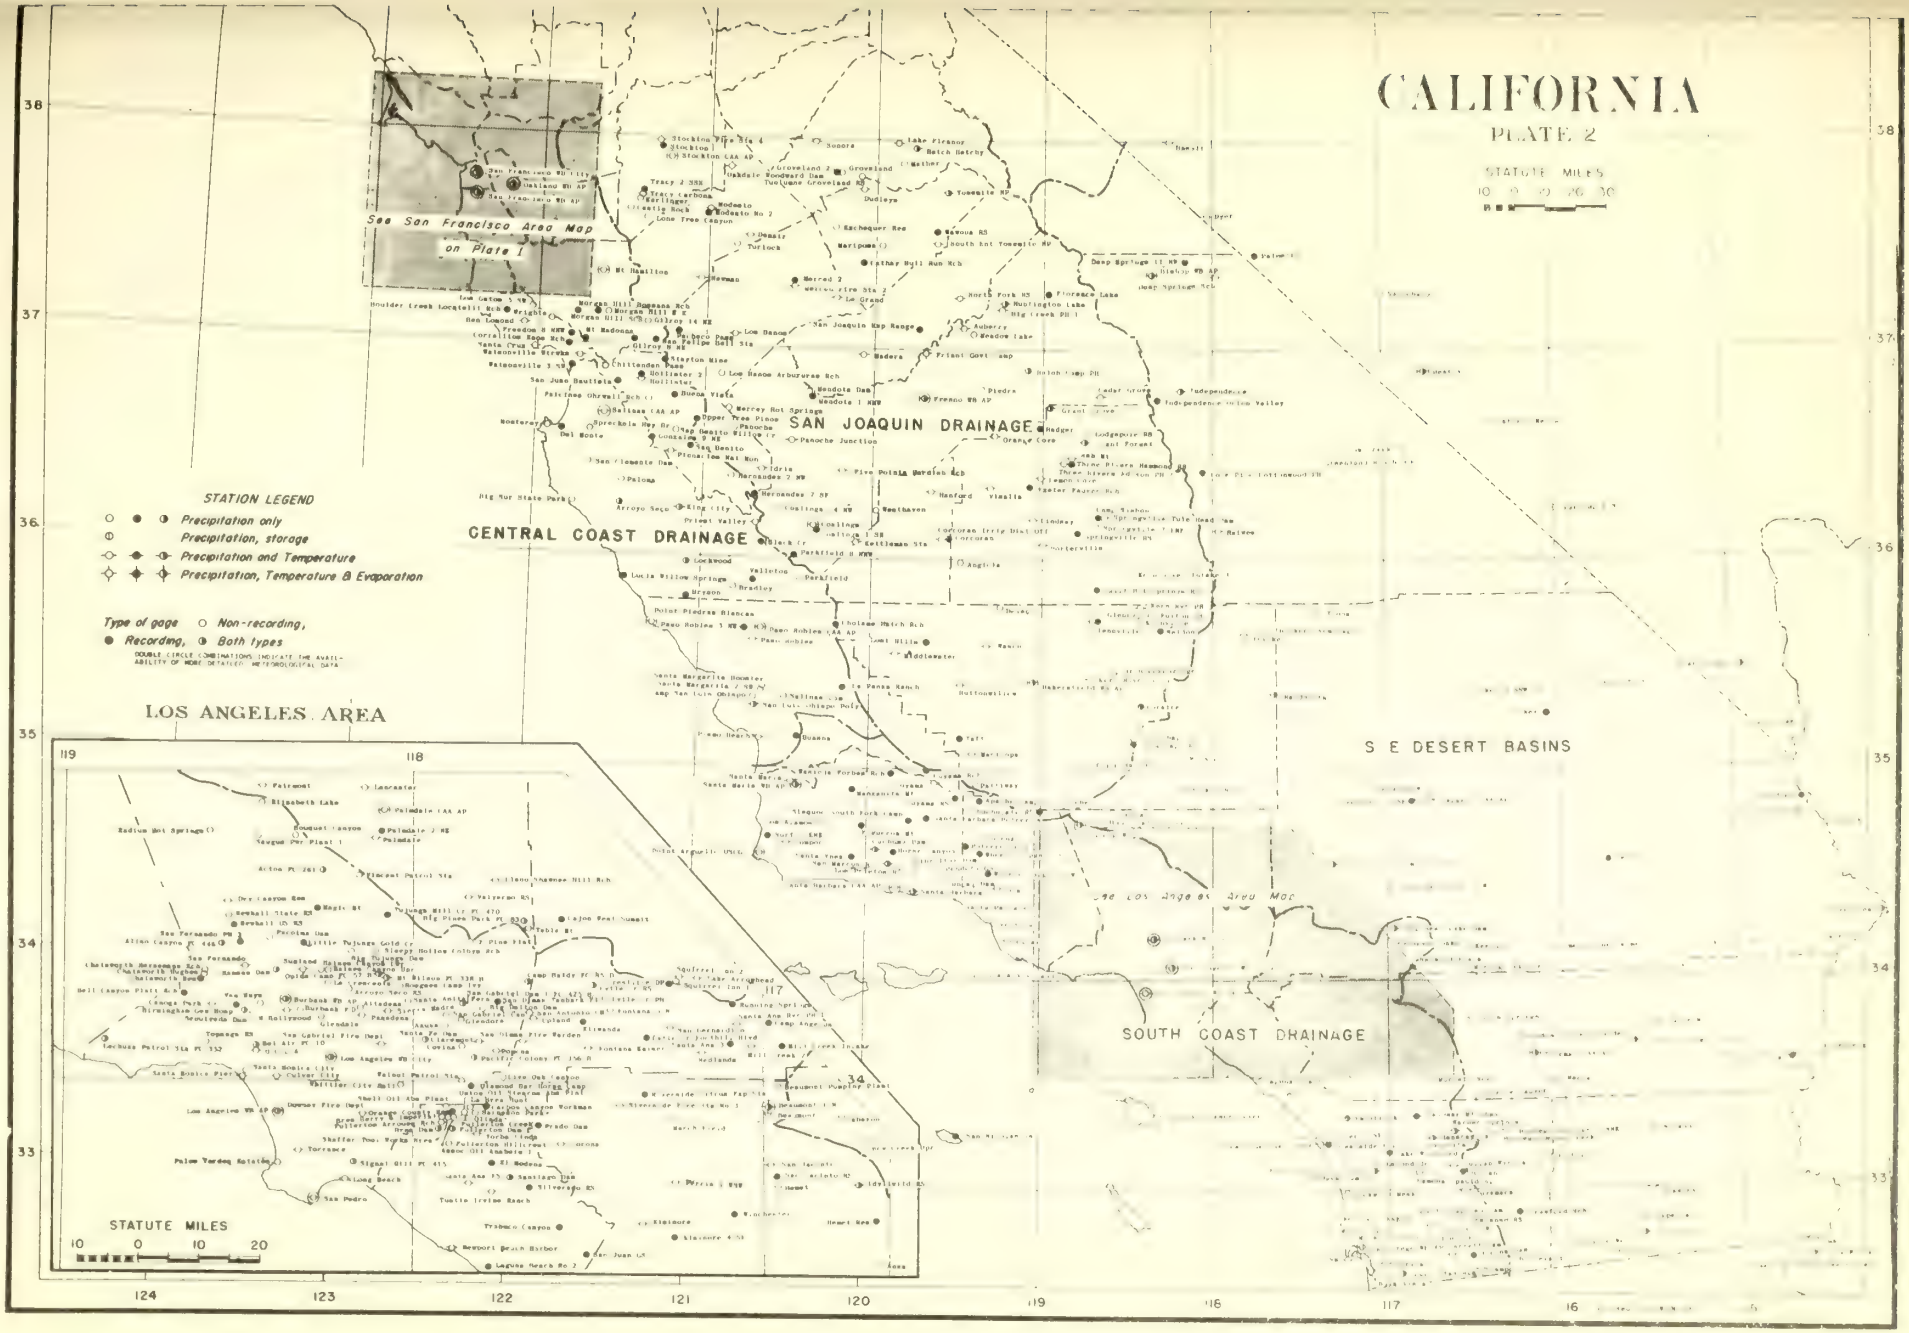
R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.



VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CLIMATOLOGICAL DATA

CALIFORNIA

AUGUST 1955
Volume LIX No. 8

ASHEVILLE: 1955

WEATHER SUMMARY

August was typically dry but it was the first month since November 1954 that temperatures averaged above normal for the State. The warm weather was beneficial for most growing crops and conditions were favorable for harvesting crops already matured. Temperatures averaged above normal in all divisions except the North and Central Coast Drainages, and it was one of the warmest Augusts of record in much of southern California. Precipitation was also markedly above normal in southern California with scattered shower and thunderstorm activity resulting in almost twice the normal August rainfall in the Southeast Desert Basins and the South Coast Drainage. The thunderstorms, accompanied by wind, rain, lightning, and locally heavy runoff, caused damage to local communities, highways, railroads, and utility companies in the Southeast Desert Basins on the 3d - 4th, 10th - 11th, 15th, 17th, and 23d.

The following was reported by the State Climatologist at San Francisco: At 1:00 a.m. on August 4, as a result of a thunderstorm, a flash flood at Needles destroyed 2 homes and caused some minor damage to 26 other homes and structures. At Cow Creek thunderstorms on the 3d and 4th were reported to have caused "light damage to Texas Spring Camp, Furnace Creek road". At Blythe, in Palo Verde Valley, on the night of the 10th - 11th, wind demolished one home, blew the roof off another, and downed many power poles, while lightning struck the California Electric Power Company circuits and transformers and caused damages estimated at several thousands of dollars. The same night at Calipatria, in the Imperial Valley, several houses were unroofed and power poles downed. One person was injured by lightning. A heavy shower fell over Mount Laguna on the afternoon of the 15th, causing minor damage to mountain cabins and resorts, and washed out some side roads and driveways. Flash floods from desert thunderstorms on the 17th closed U. S. Highway 60/70 between Desert Center and Blythe when three bridge approaches were washed out. Rail connections between Los Angeles and Las Vegas, Nevada, were blocked by undermined roadbeds, debris, and a washed-out bridge. At Niland high water caused considerable damage to canals, drains, roads, and crops, and caused several minor accidents. The Hayfield Pumping Plant near Desert Center reported 2.01 inches of rain between 3:30 p.m. and 4:45 p.m. on the 17th (measured on the 18th). A thunderstorm at Barstow on August 23d caused flood damages to homes and stores in the path of the runoff estimated at thousands of dollars. Barstow was temporarily isolated due to washed-out roads and downed telephone lines. Most of the rain was reported confined to the southern section of Barstow where considerably more rain fell than the 0.82 inch measured at the cooperative observer's rain gage located in the northeast section of town.

With isolated exceptions temperatures averaged above normal for August over the entire State except along the immediate coastal area from Laguna Beach to Crescent City, the temperatures at Crescent City averaging 4.0° below normal for the greatest negative departure in the State. At Eureka it was the coolest August since 1910 when the mean temperature was also 53.4°. At San Francisco it was the 10th consecutive month with below normal temperatures, and the mean equalled the record lowest August mean of 1901. Temperatures averaged near normal to slightly above over the Central Valley and from 2° to 4° above normal from the Northeast Interior Basins southward along the Sierras to the Riverside-Escondido area, the greatest positive anomaly occurring at Escondido Church Ranch where August temperatures averaged 5.4° above normal. At Burbank it was the hottest August on record and at San Diego the mean August temperature was exceeded only once in 1871 and equalled twice. It was the second warmest August at Sandberg since the station was established in 1932. Although the mean maximum temperature was the second highest in 79 years of record at Sacramento, the average minimum was about normal. Temperatures rose to 90° or higher on 24 days of the month tying the record and comparing with an average of 14 days. At Red Bluff there were 27 consecutive days with temperatures 95° or higher, a period exceeded only in 1878, 1879, 1901, and 1939. The mean temperature of 102.5° for the month at Cow Creek was reported the highest of record at that station. Daily temperature departures from normal were fairly consistent in following the trend of the monthly means -- generally consistently near to above normal inland and below normal along the coast; daily temperatures averaged below normal every day of the month at Eureka. High temperatures for most stations occurred in the first week or the last two days of the month. The 98° reached at Los Angeles and San Diego on the 31st was the highest August temperature of record. The State high of 122° was reported at Greenland Ranch on the 3d. Low temperatures were generally scattered through the last half of the month with the low for the State recorded at Boca with 24° the 26th.

August was typically dry over most of the State with no precipitation at all measured at 308 stations. The only significantly above normal rains fell in scattered showers and thunderstorms in southern California; stations in the coastal mountains east of San Diego and in the area within a line Big Bear Lake Dam-Barstow-Needles-Parker Reservoir-Blythe-Big Bear Lake Dam received from two to more than five times the normal precipitation. The greatest precipitation was recorded at Warner Springs where the total of 5.26 inches was almost six times the August normal. At Iron Mountain more than seven times the normal precipitation fell during the month. Thunderstorm and shower activity was primarily restricted to the higher areas of the South Coast Drainage and the Southeast Desert Basins through the 23d. A number of stations in this area received 24-hour rains of more than one inch, the greatest observational-day precipitation being recorded on the 18th at Hayfield Pumping Plant with 2.01 inches, all but 0.24 of the monthly total.

Cloudiness was above normal at San Diego, Sandberg, Bakersfield, Bishop, Fresno, and Eureka, and below normal at the other stations listed in the Supplemental Data table. At Red Bluff the 99 percent of the possible sunshine received in August brought the July-August percentage to 98-1/2 which has only been exceeded at that station by the months of June-July 1951 and August-September 1932. Wind speeds were generally near or below normal at all reporting stations except Red Bluff where the hourly average wind speed was 2.3 m.p.h. higher than normal.

The following was extracted from reports of the California Crop and Livestock Reporting Service: Warm weather during August was beneficial for most crops and on September 1 above average prospects were reported for corn, grain sorghums, rice, beans, cotton, sugar beets, hops, and potatoes. These crops made good progressive development this year but were still somewhat later than usual because of the cool spring and early summer weather. Alfalfa continued late, and an infestation of spotted alfalfa aphid was causing damage. Harvesting wheat barley, oats, grain hay,and flax was about complete in main areas. Temperatures were also favorable for harvesting fruit and nut crops which had matured in August. It had been a little too cool for early development of fruit crops until mid-July which caused many fruits to ripen later than usual this year. Sizes of some crops were also reduced. Fire danger in forests and ranges increased during August becoming critical by month's end. Range feed was above average and was expected to be sufficient for normal fall needs. The reported average condition of all pasture and range feed at 77 percent of normal is one point above the average for September 1 but four points below last year's level. Stockwater supplies were diminishing seasonally but were generally sufficient for current needs.

Robert F. Dale
